## ABSTRAK

Studi kasus ini berada pada salah satu pabrik vulkanisir yang melakukan penambahan ragi ban bekas agar bisa digunakan kembali. Permasalahan yang terjadi di perusahaan ialah besarnya jarak tempuh *material handling* menyebabkan biaya tinggi yang dikeluarkan oleh perusahaan. Tujuan penelitian ini adalah perlu merancang ulang tata letak produksi guna mendapatkan alur proses dan biaya *material handling* yang optimal. Metode yang digunakan ialah membandingkan antara metode ALDEP (*Automated Layout Design Program*) yang mendapatkan *layout* usulan berdasarkan hubungan derajat kedekatan antar departemen dan metode CRAFT (*Computerized Relatfue Allocation Facilities Technique*) yang mendapatkan *layout* usulan berdasarkan pertukaran antar departemen dengan pertimbangan jarak antar departemen tanpa melakukan pendekatan antar masing-masing departemen. Hasil dari penelitian ini diperoleh bahwa *layout* usulan terbaik terdapat pada metode ALDEP (*Automated Layout Design Program*) dengan jarak tempuh *material handling* dan efisiensi sebesar 5009,65 meter dan 34,20% dari jarak *material handling* awal. Lebih lanjut diperoleh biaya *material handling* dan efisiensi sebesar Rp 676.322 dan 35% dari biaya *material handling* awal. Implikasi terhadap penelitian ini berupa adanya *layout* usulan terbaik dengan jarak tempuh dan biaya *material handling* yang minimum yang dapat dijadikan bahan rekomendasi bagi perusahaan. Untuk penelitian selanjutnya perlu kiranya menambahkan metode simulasi untuk memberikan usulan berupa jumlah stasiun optimal.

## ABSTRACT

This research was conducted in one of vulcanized factories which worked to add used trace tire yeast to be reusable. The problems of the research was the amount of *material handling* mileage caused the high cost incurred by the company. The objective of this research was to redesign the production layout to get the process flow and optimal cost *material handling*. The method used is to compare the ALDEP method (*Automated Layout Design Program*) which obtained the proposed layout based on the degree of proximity relationship between the department and the CRAFT method (*Computerized Relative Allocation Facilities Technique*) which acquired the proposed layout based on inter-department exchange with the consideration of the distance between departments without doing approachment between departments. The result of this research shows that the best-proposed layout is in ALDEP method (*Automated Layout Design Program*) with the mileage of *material handling* and efficiency of 5009.65 meters and 34.20% from initial distance of *material handling*. Further *material handling* and efficiency IDR 676,322 and 35% of the cost of initial *material handling*. The implication of this research is the best proposal layout with mileage and cost of minimum *material handling* that could be used as recommendation material for the company. For further research, it is necessary to add a simulation method to suggest the optimal number of stations.
